13 UNITED STATES DISTRICT COURT

14 FOR THE EASTERN DISTRICT OF CALIFORNIA

15 FRESNO DIVISION

16
17 UNITE THE PARKS; SEQUOIA
18 FORESTKEEPER; and EARTH ISLAND
INSTITUTE,

19 Plaintiffs,

20 v.

21 UNITED STATES FOREST SERVICE, an
22 agency of the U.S. Department of Agriculture;
23 and UNITED STATES FISH AND
WILDLIFE SERVICE, an agency of the U.S.
Department of the Interior,

24 Defendants.

25 Case No.

26
27
28 **COMPLAINT FOR DECLARATORY
JUDGMENT AND INJUNCTIVE RELIEF**

Case No.

COMPLAINT FOR DECLARATORY JUDGMENT AND INJUNCTIVE RELIEF

INTRODUCTION

1 1. This action challenges the failure of the United States Forest Service (“USFS”) and
2 United States Fish and Wildlife Service (“FWS”) to adequately evaluate, protect, and conserve
3 the critically endangered Southern Sierra Nevada Pacific fisher (“SSN fisher” or “fisher”) on the
4 Sierra, Sequoia, and Stanislaus National Forests, as required by the Endangered Species Act
5 (“ESA”), 16 U.S.C. § 1531 *et seq.*, and the National Environmental Policy Act (“NEPA”), 42
6 U.S.C. § 4321 *et seq.*

7 2. The SSN fisher is a geographically isolated and genetically unique population of
8 the Pacific fisher (*Pekania pennanti*) that is teetering on the brink of extinction. A decade ago,
9 scientists using habitat-based models estimated that the SSN fisher population consists of
10 somewhere between 100 and 500 individuals, far below the science-based consensus that the
11 minimal viable population size for terrestrial mammals is greater than 3,800 individuals. Since
12 those SSN fisher population estimates were developed, suitable fisher denning and resting habitat,
13 which is essential for reproduction, has been reduced by more than 50 percent on the Sierra and
14 Sequoia National Forests as a result of a prolonged multi-year drought and significant wildfires
15 (including two massive wildfires in late 2020) or destroyed or degraded into non-habitat by
16 continued logging and other “vegetation management” activities by USFS. These landscape
17 alterations have likely reduced individual SSN fisher numbers and adversely affected their long-
18 term prospects for survival.

19 3. Despite dramatic changes in the environmental baseline conditions for SSN fisher
20 habitat over the last decade, USFS has continued to plan and carry out significant logging and
21 related “vegetation management” activities, and FWS has continued to sanction such activities,
22 without considering and evaluating the current population size or viability of the SSN fisher or
23 conducting a cumulative impacts analysis of these activities. These management activities are
24 spread across at least 45 individual “projects” approved incrementally by USFS over many years.

25 4. Because the SSN fisher is listed as an endangered species under the ESA, the most
26 recent wildfires on the Sierra and Sequoia National Forests during the late summer and fall of
27 2020, which burned more than half a million acres, including tens of thousands of acres of SSN

1 fisher habitat, required USFS and FWS to reinitiate ESA consultation in connection with ongoing
2 and proposed USFS activities and projects. As part of this consultation, USFS summarily
3 concluded that even though the 2020 wildfires affected nearly 300,000 acres of fisher habitat and
4 burned through several identified corridors through which fishers travel and disperse from one
5 habitat area to another, the fires will not materially affect the survival of the SSN fisher and thus
6 do not require alteration of previously-planned USFS logging projects, and FWS subsequently
7 endorsed that USFS conclusion in its revised Programmatic Biological Opinion. In carrying out
8 this consultation and reaching these conclusions, neither agency conducted any new population
9 estimates or viability analysis, nor did they provide any relevant science to support their
10 conclusions about fisher populations.

11 5. Instead, the agencies' conclusions were based on a theory that, while proposed
12 USFS projects will continue to have short-term adverse impacts on fishers, the actions and
13 activities approved as part of these projects will, over the next several decades, reduce wildfire
14 risks and thereby actually "benefit" fishers in the long term. There is no evidence-based science to
15 support this theory, which merely provides an unsubstantiated justification for USFS to continue
16 logging trees and disrupting essential fisher habitat features that the agencies concede will take
17 decades or centuries to reestablish. Moreover, in the course of making the assertion that further
18 logging would reliably and consistently reduce future fire severity, the agencies ignored a deep
19 body of scientific evidence concluding that commercial thinning, post-fire logging, and other
20 logging activities conducted under the rubric of "fuel reduction" more often tend to *increase*, not
21 decrease, fire severity.

22 6. The listing of the SSN fisher as an endangered species on May 15, 2020 and the
23 subsequent wildfires that burned over 500,000 acres during the late summer and fall of 2020
24 constitute significant new circumstances and information relevant to the impact of the USFS's
25 ongoing and proposed management actions on the fisher and its habitat that have never been
26 considered in any cumulative environmental review under NEPA. USFS approvals for the 45
27 logging and other "vegetation management" projects that could affect SSN fishers and fisher
28 habitat were accompanied by individual project analyses that did not evaluate these subsequent

1 cumulative impacts and could not have done so. Yet USFS intends to move forward with these
2 projects in the absence of any supplemental environmental review or cumulative effects evaluation
3 under NEPA.

4 7. By failing to undertake adequate evaluation of aggregate effects, by failing to use
5 the best available science, by relying on speculative and unsupported theories of long-term
6 benefits, and by failing to protect and conserve the SSN fisher, USFS and FWS have violated, and
7 are continuing to violate, the ESA and its implementing regulations, and USFS has violated, and is
8 continuing to violate, NEPA and its implementing regulations. Accordingly, the Court should set
9 aside and vacate FWS's revised Programmatic Biological Opinion, enjoin the logging and other
10 "vegetation management" actions detailed below, and order USFS to prepare a supplemental
11 NEPA analysis for the cumulative effects of its proposed activities on the SSN fisher.

JURISDICTION AND VENUE

13 8. This Court has jurisdiction over this action pursuant to 28 U.S.C. § 1331 (federal
14 question), 16 U.S.C. § 1540(g) (ESA citizen suits), and 28 U.S.C. §§ 2201 and 2202 (Declaratory
15 Judgment Act). Plaintiffs have exhausted all administrative remedies, and the violations of law
16 claimed below are ripe for judicial review.

17 9. Venue lies in this District, pursuant to 28 U.S.C. § 1331(e), because the property
18 and events giving rise to this lawsuit occur in this District and because Defendants reside within
19 the District.

20 10. Because a substantial part of one of the events or omissions which give rise to the
21 claims herein – the various projects in the Sierra, Sequoia, and Stanislaus National Forests –
22 occurred in Fresno, Kern, Tulare, Madera, Mariposa, and Tuolumne Counties, assignment to the
23 Fresno Division of this Court is proper under Civil Local Rule 120(d).

11. An actual justiciable controversy exists between the parties hereto.

PARTIES

26 12. Plaintiff UNITE THE PARKS (“UTP”) is a non-profit organization located in
27 Mariposa and Los Osos, California. Its mission is to protect and interconnect biologically
28 important landscapes for wildlife and for people, for all time. UTP’s most immediate goal is to

1 preserve the federal land between Yosemite and Kings Canyon National Parks and to create the
2 Range of Light National Monument. UTP's primary focus area is the Sierra National Forest and
3 the BLM lands in the vicinity of the forest. To support that goal, UTP has four program areas: (1)
4 grassroots campaigning and lobbying (2) litigation as related to the Pacific fisher, (3) education
5 via a college internship program, and (4) education via an at-risk youth summer leadership
6 program in the Sierra Nevada. UTPs' rural members reside in Mariposa, Madera, Fresno,
7 Tuolumne, El Dorado, Mono and Inyo Counties, and its urban members are located in the Bay
8 Area and Southern California. UTP's long-term overarching goal is to create interconnected
9 habitat refuges for wildlife and recreational areas and parks for people in the Sierra Nevada and
10 across the state and nation. To achieve these goals, UTP has been actively engaged in advocating
11 for the conservation of Pacific fisher on the Sierra and Sequoia National Forests and for the
12 curtailment of logging projects and activities that may affect this species.

13 13. Plaintiff SEQUOIA FORESTKEEPER ("SFK") is a non-profit corporation residing
14 in Kernville, California. Its mission is to protect and restore the ecosystems of the Southern Sierra
15 Nevada, including, but not limited to, the Giant Sequoia National Monument, Sequoia National
16 Forest, and Mountain Home State Forest through monitoring, enforcement, education, and
17 litigation. Sequoia ForestKeeper's members, many of whom reside in local areas including Kern,
18 Tulare, Fresno, and Kings Counties, and others who visit from across the country, use and
19 continue to use the national forests of the Southern Sierra Nevada for activities such as hiking,
20 bird and animal watching (including the endangered Pacific fisher), aesthetic enjoyment, quiet
21 contemplation, fishing, scientific study, and to improve their health, including the exact tracts of
22 the lands and waters that are now planned for logging and vegetation management in the Sequoia
23 and Sierra National Forests. Many of its members also have been actively involved in formulating
24 management policies for public lands and preserving local areas, including participating in
25 revising the Sequoia National Forest plan, the establishment and development of the Giant
26 Sequoia National Monument, and the protection of wildlife habitat including that of the Pacific
27 fisher.

28

1 14. Plaintiff EARTH ISLAND INSTITUTE (“EII”) is a nonprofit corporation
2 organized under the laws of the State of California. EII is headquartered in Berkeley, California.
3 EII is a membership organization with over 15,000 members in the U.S., over 3,000 of whom use
4 and enjoy the National Forests of California for recreational, educational, aesthetic, spiritual, and
5 other purposes. EII’s mission is to develop and support projects that counteract threats to the
6 biological and cultural diversity that sustains the environment. Through education and activism,
7 these projects promote the conservation, preservation and restoration of the earth. One of these
8 projects is the John Muir Project—whose mission is to protect all federal public forestlands from
9 commercial exploitation that undermines and compromises science-based ecological management.
10 John Muir Project offices are in San Bernardino County, California. EII’s John Muir Project and
11 EII members actively participate in governmental decision-making processes with respect to
12 national forest lands in California and rely on information provided through the NEPA processes
13 to increase the effectiveness of their participation. EII’s members include individuals who
14 regularly use and continue to use public lands within the Southern Sierra Nevada National Forests
15 – including the exact tracts of lands in the Sierra, Sequoia, and Stanislaus National Forest areas
16 proposed for logging – for scientific study, recreational enjoyment, aesthetic beauty, nature
17 photography, and wildlife observation. These members’ interests will be irreparably harmed by
18 the planned logging and vegetation management activities, as they will no longer be able to
19 scientifically study these areas in their pre-logging state, take nature photographs of the area in its
20 pre-logging state, or enjoy the aesthetic beauty of the unlogged forest habitat and its inhabitants,
21 especially the endangered Pacific fisher.

22 15. This suit is brought by UTP, EII, and SFK on behalf of themselves and their
23 adversely affected members and staff. Plaintiffs and their members’ present and future interests
24 in, and use of, the Sierra, Sequoia, and Stanislaus National Forest areas planned for logging and
25 vegetation management actions in Pacific fisher habitat are and will be directly and adversely
26 affected by the agencies’ impending actions. Those adverse effects include, but are not limited to:
27 (1) impacts to native plants and wildlife and their habitats—especially those of the Pacific fisher—
28 within and around the Project areas from logging and vegetation management; (2) reduction and

1 impairment of recreation opportunities; (3) impairment of aesthetic values of forest lands, trails,
2 and landscapes caused by Defendants' logging and vegetation management; and (4) loss of
3 scientific study and viewing opportunities with regard to wildlife in areas proposed for logging
4 and vegetation management. In addition, Plaintiffs and their members and staff have an interest in
5 ensuring that Defendants comply with all applicable laws, regulations, and procedures pertaining
6 to the management of national forest lands.

7 16. Defendants' failure to comply with the requirements of the ESA, NEPA, and the
8 Administrative Procedure Act ("APA"), 5 U.S.C. § 551 *et seq.*, when authorizing and
9 implementing the various logging and other "vegetation management" actions at issue in this
10 lawsuit has caused and is causing actual and imminent harm to Plaintiffs' interests, as described
11 above, and to the SSN fisher that they seek to protect. Plaintiffs rely on USFS and FWS to
12 comply with the procedural and substantive requirements of these laws for the protection and
13 conservation of the SSN fisher and its habitat. A favorable decision by the Court in this case will
14 redress the actual and imminent injury to Plaintiffs and the harm to the SSN fisher and its habitat.
15 A court order directing USFS and FWS to comply with the ESA and NEPA could result in a
16 substantial change to the various activities to minimize or avert harm to Plaintiffs' members and
17 the SSN fisher from the logging, vegetation management activities, and destruction of fisher
18 habitat caused by Defendants' continuing actions.

19 17. Defendant UNITED STATES FOREST SERVICE is a federal agency within the
20 U.S. Department of Agricultural which manages federal public lands within the Sierra, Sequoia,
21 and Stanislaus National Forests and which has authorized at least 45 management projects that are
22 the subject of a Programmatic Biological Opinion at issue in this case. USFS is responsible for
23 ensuring that all resource management decisions on these lands comply with applicable laws and
24 regulations.

25 18. Defendant UNITED STATES FISH AND WILDLIFE SERVICE is a federal
26 agency within the U.S. Department of the Interior which is charged with administration of the
27 ESA and which issued the Programmatic Biological Opinion and Incidental Take Statement and
28

1 Amended Programmatic Biological Opinion at issue in this case. FWS is responsible for ensuring
 2 that its opinions and authorizations comply with the ESA.

3 STATUTORY AND REGULATORY FRAMEWORK

4 A. The Endangered Species Act

5 19. Recognizing that certain species of plants and animals “have been so depleted in
 6 numbers that they are in danger of or threatened with extinction,” Congress enacted the ESA both
 7 “to provide a means whereby the ecosystems upon which endangered and threatened species
 8 depend may be conserved, [and] to provide a program for the conservation of such endangered
 9 species and threatened species.” 16 U.S.C. § 1531. The ESA reflects “an explicit congressional
 10 decision to afford first priority to the declared national policy of saving endangered species.”
 11 *Tenn. Valley Auth. v. Hill*, 437 U.S. 153, 185 (1978). “The plain intent of Congress in enacting
 12 this statute was to halt and reverse the trend toward species extinction, whatever the cost.” *Id.* at
 13 184. The ESA “represent[s] the most comprehensive legislation for the preservation of
 14 endangered species ever enacted by any nation.” *Id.* at 180. The ESA vests primary responsibility
 15 for administering and enforcing the statute in connection with terrestrial species with the Secretary
 16 of the Interior, who has delegated this responsibility to FWS.

17 20. Under the ESA, a species may be listed as endangered or threatened. An
 18 endangered species – a status which is reserved for species in the most perilous condition – is one
 19 that is “in danger of extinction throughout all or a significant portion of its range.” 16 U.S.C. §
 20 1532(6).

21 21. Section 9 of the ESA makes it unlawful for any person to “take” an endangered
 22 species without express authorization from FWS. 16 U.S.C. § 1538(a)(1). “Take” means “to
 23 harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in
 24 any such conduct.” 16 U.S.C. § 1532(19). The term “harm” is further defined by FWS regulations
 25 to encompass habitat modification or degradation that injures an endangered species by
 26 significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering, *see*
 27 50 C.F.R. § 17.3, and “harass” is defined as “an intentional or negligent act or omission which
 28 creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly

1 disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding or
 2 sheltering.” *Id.*

3 22. Section 7(a)(1) of the ESA directs all federal agencies, in consultation with the
 4 Secretary of the Interior, to “utilize their authorities in furtherance of the purposes of [the ESA] by
 5 carrying out programs for the conservation of [listed] species.” 16 U.S.C. § 1536(a)(1).
 6 “Conservation” means “to use and the use of all methods and procedures which are necessary to
 7 bring any endangered species … to the point at which the measures provided pursuant to this
 8 chapter are no longer necessary.” *Id.* 17 § 1532(3).

9 23. Section 7(a)(2) of the ESA requires all federal agencies to “insure that any action
 10 authorized, funded, or carried out by such agency . . . is not likely to jeopardize the continued
 11 existence of any endangered species.” 16 U.S.C. § 1536(a)(2). As defined by the ESA’s
 12 implementing regulations, an action will cause “jeopardy” to a listed species if it “reasonably
 13 would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival
 14 and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution
 15 of that species.” 50 C.F.R. § 402.02.

16 24. To carry out this section 7(a)(2) obligation, an action agency must engage in
 17 consultation with FWS *before* undertaking any action that may have direct or indirect effects on
 18 listed species in order to evaluate the impact of the proposed action. 16 U.S.C. § 1536(a). FWS
 19 has defined the term “action” for the purposes of section 7 broadly to mean “all activities or
 20 programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies,”
 21 50 C.F.R. § 402.02, “in which there is discretionary federal involvement or control.” *Id.* § 402.03.

22 25. In consultation, FWS must “use the best scientific . . . data available” in evaluating
 23 the effects of the proposed action on listed species. 16 U.S.C. § 1536(a)(2). The result of a formal
 24 consultation is the preparation of a biological opinion (“BO”) by FWS, which is a compilation and
 25 analysis of the best available scientific data on the status of the species and how it would be
 26 affected by the proposed action. When preparing a BO, FWS must: (1) “review all relevant
 27 information;” (2) “evaluate the current status of the listed species;” and (3) “evaluate the effects of
 28 the action and cumulative effects on the listed species or critical habitat.” 50 C.F.R. § 402.14(g).

1 As such, a BO must include a description of the proposed action, a review of the status of the
 2 species and critical habitat, a discussion of the environmental baseline, and an analysis of the
 3 direct and indirect effects of the proposed action and the cumulative effects of reasonably certain
 4 future state, tribal, local, and private actions. *Id.*

5 26. As part of consultation, FWS must independently analyze whether the proposed
 6 action will reduce the likelihood of recovery of the list species, separate from its survival. 50
 7 C.F.R. § 402.02; *Gifford Pinchot Task Force v. U.S. Fish & Wildlife Serv.*, 387 F.3d 968, 1070
 8 (9th Cir. 2004); *Nat'l Wildlife Fed'n v. Nat'l Marine Fisheries Serv.*, 524 F.3d 917, 933 (9th Cir.
 9 2008).

10 27. If FWS determines that the proposed action is not likely to jeopardize the continued
 11 existence of listed species or adversely modify critical habitat but will nevertheless result in the
 12 incidental take of listed species, then FWS will provide the action agency with a written Incidental
 13 Take Statement (“ITS”). The ITS must specify the “impact of such incidental taking on the
 14 species” and “any reasonable and prudent measures that [FWS] considers necessary or appropriate
 15 to minimize such impact” and must set forth “the terms and conditions . . . that must be complied
 16 with by the [action] agency . . . to implement [those measures].” 16 U.S.C. § 1536(b)(4).

17 28. Where a BO has been issued and “discretionary Federal involvement or control
 18 over the action has been retained or is authorized by law,” the action agency is required to
 19 reinitiate consultation with FWS “[i]f new information reveals effects of the action that may affect
 20 listed species or critical habitat in a manner or to an extent not previously considered,” or “the
 21 identified action is subsequently modified in a manner that causes an effect to the listed species . .
 22 . that was not considered in this programmatic biological opinion.” 50 C.F.R. § 402.16(a)(2)-(3).
 23 The ESA provides that agencies must hold action in abeyance until any legally required
 24 consultation is complete. Section 7(d) of the ESA prohibits an action agency from making “any
 25 irreversible or irretrievable commitment of resources with respect to the agency action which has
 26 the effect of foreclosing the formulation or implementation of any reasonable and prudent
 27 alternative measures which would not violate [Section 7] (a)(2).” 16 U.S.C. § 1536(d). “This
 28 prohibition . . . continues until the requirements of section 7(a)(2) are satisfied.” 50 C.F.R. §

1 402.09. The purpose of this requirement is to ensure that the status quo will be maintained during
 2 the consultation process. *See Lane Cty. Audubon Soc'y v. Jamison*, 958 F.2d 290, 294 (9th
 3 Cir.1992).

4 **B. The National Environmental Policy Act**

5 29. Congress enacted NEPA “[t]o declare a national policy which will encourage
 6 productive and enjoyable harmony between man and his environment; to promote efforts which
 7 will prevent or eliminate damage to the environment and biosphere and stimulate the health and
 8 welfare of man; [and] to enrich the understanding of the ecological systems and natural resources
 9 important to the Nation.” 42 U.S.C. § 4321.

10 30. NEPA has two fundamental purposes: (1) to guarantee that, before taking an
 11 action, federal agencies take a “hard look” at the consequences of that action to ensure that “the
 12 agency, in reaching its decision, will have available, and will carefully consider, detailed
 13 information concerning significant environmental impacts;” and (2) to ensure that “the relevant
 14 information will be made available to the larger audience that may also play a role in both the
 15 decisionmaking process and the implementation of that decision.” *Robertson v. Methow Valley*
 16 *Citizens Council*, 490 U.S. 332, 349-50 (1989).

17 31. To accomplish these purposes, NEPA requires all agencies of the federal
 18 government to prepare a “detailed statement” that discusses the environmental impacts of, and
 19 reasonable alternatives to, all “major Federal actions significantly affecting the quality of the
 20 human environment.” 42 U.S.C. § 4332(2)(C). This statement is commonly known as an
 21 environmental impact statement (“EIS”). The EIS must define the purpose and need for the
 22 project, must describe the proposed action and the existing environmental setting, must evaluate
 23 adverse direct, indirect, and cumulative environmental effects of the proposed action, and must
 24 explore alternatives to and mitigation measures for the proposed action. *See, e.g., City of Carmel-*
By-The-Sea v. U.S. Dep't of Transp., 123 F.3d 1142, 1162 (9th Cir. 1997); *Neighbors of Cuddy*
Mountain v. U.S. Forest Serv., 137 F.3d 1372, 1378 (9th Cir. 1998).

27 32. To determine whether a proposed action significantly affects the environment, and
 28 whether an EIS is required, the acting agency may first prepare an Environmental Assessment

1 (“EA”). An EA must provide sufficient evidence and analysis to determine whether to prepare an
 2 EIS. If the agency concludes that a project may have significant impacts on the environment, it
 3 must prepare an EIS. If the EA concludes that there are no significant impacts to the
 4 environment, the federal agency must provide a detailed statement of reasons why the project's
 5 impacts are insignificant and issue a “finding of no significant impact.” Even an EA, however,
 6 must consider the action's cumulative impact on the environment, which is the impact that results
 7 from the incremental impact of the action when added to other past, present, or reasonably
 8 foreseeable future actions. *See, e.g., Native Ecosystems Council v. Dombeck*, 304 F.3d 886, 895
 9 (9th Cir. 2002).

10 33. The EIS must “provide full and fair discussion of significant environmental impacts
 11 and shall inform decision-makers and the public of the reasonable alternatives which would avoid
 12 or minimize adverse impacts or enhance the quality of the human environment.” 40 C.F.R. §
 13 1502.1. To satisfy this obligation, agencies must take a “hard look” at a project's environmental
 14 impacts – essentially, “a discussion of adverse impacts that does not improperly minimize
 15 negative side effects.” *Earth Island Inst. v. United States Forest Serv.*, 442 F.3d 1147, 1159 (9th
 16 Cir. 2006).

17 34. Consideration of synergistic or cumulative effects between different projects and
 18 environmental factors is a key part of the agency's determination for “significant” environmental
 19 impacts, which inherently “includes considerations of both the context and the intensity of the
 20 possible effects.” *Bark v. United States Forest Serv.*, 958 F.3d 865, 869 (9th Cir. 2020). Context
 21 “delimits” the scope of the agency's action and review. *Id.* The cumulative analysis requirement
 22 is essential to ensure agencies do not “impermissibly subject the decisionmaking process
 23 contemplated by NEPA to the tyranny of small decisions.” *Kern v. BLM*, 284 F.3d 1062, 1078
 24 (9th Cir. 2002).

25 35. The “heart of the environmental impact statement” is its analysis of alternatives to
 26 the agency's proposed action. *See, e.a., League of Wilderness Defs./Blue Mountains Biodiversity*
Project v. U.S. Forest Serv., 689 F.3d 1060, 1069 (9th Cir. 2012). An EIS also must discuss
 27 mitigation measures for the proposed action “with sufficient detail to ensure that environmental

1 consequences have been fairly evaluated,”” including by addressing whether the measures “can be
 2 effective” at reducing environmental impacts. *S. Fork Band Council of W. Shoshone of Nev. v.*
 3 *U.S. Dep’t of Interior*, 588 F.3d 718, 727 (9th Cir. 2009) (quoting *Robertson*, 490 U.S. at 348).

4 36. A federal agency must conduct supplemental environmental review if “[t]here are
 5 significant new circumstances or information relevant to environmental concerns and bearing on
 6 the proposed action or its impacts.” 40 C.F.R. § 1502.9(d)(1)(ii). Agencies must “continu[e] to
 7 maintain a ‘hard look’ at the impact of agency action when the ‘new information is sufficient to
 8 show that the remaining action will affect the quality of the human environment in a significant
 9 manner or to a significant extent not already considered.’” *League of Wilderness Defs./Blue Mts.*
 10 *Biodiversity Project v. Connaughton*, 752 F.3d 755, 760 (9th Cir. 2014) (quoting *Marsh v. Ore.*
 11 *Natural Res. Council*, 490 U.S. 360, 373-74, 109 S. Ct. 1851, 104 L. Ed. 2d 377 (1989).

12 **C. Administrative Procedure Act**

13 37. The Administrative Procedure Act (“APA”), 5 U.S.C. §§ 701-706, provides for
 14 judicial review of agency action. Under the APA, a reviewing court must “hold unlawful and set
 15 aside agency action, findings, and conclusions” found to be “arbitrary, capricious, an abuse of
 16 discretion, or otherwise not in accordance with law” or “unsupported by substantial evidence in
 17 the record.” *Id.* § 706(2)(A). An agency action is arbitrary and capricious if the agency “relied on
 18 factors which Congress has not intended it to consider, entirely failed to consider an important
 19 aspect of the problem, offered an explanation for its decision that runs counter to the evidence
 20 before the agency,” or if the agency’s decision “is so implausible that it could not be ascribed to a
 21 difference in view or the product of agency expertise.” *Motor Vehicle Mfr. Ass’n v. State Farm*
 22 *Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983).

23 38. When reviewing agency action under the APA, a court must ensure that the agency
 24 reviewed the relevant data and articulated a satisfactory explanation establishing a “rational
 25 connection between the facts found and the choice made.” *Id.* at 43. The agency’s failure to do so
 26 renders its decision arbitrary and capricious. *Marsh v. Or. Natural Res. Council*, 490 U.S. 360,
 27 378 (1989).

1 39. Under the APA, a reviewing court must also set aside agency action, findings, and
2 conclusions found to be without observance of procedure required by law. 5 U.S.C. § 706(2)(D).
3 Additionally, reviewing courts may “compel agency action unlawfully withheld or unreasonably
4 delayed.” *Id.* § 706(1).

FACTUAL BACKGROUND

A. Listing of SSN Fisher as Endangered

7 40. A relative of minks and otters, the Pacific fisher is a medium-size carnivorous
8 mammal – about the size of a house cat – that once roamed the West Coast from British Columbia
9 to Southern California. 85 Fed. Reg. 29,532, 29,537 (May 15, 2020).

10 41. The isolated Pacific fisher population that occupies the southern Sierra Nevada
11 Mountains today is critically imperiled. Population estimates for the SSN fisher, based on habitat
12 modeling from 2011 and earlier, suggest that as of 2012, there were somewhere between 100 and
13 500 individuals fishers, but likely less than 300 adults. *See* 85 Fed. Reg. 29,532, 29,563 (May 15,
14 2020). These estimates were developed more than ten years ago, before an extraordinary drought
15 and subsequent tree mortality from drought stress, native beetles, and several major wildfires
16 altered the landscape; these changes resulted in a reduction of essential fisher denning and resting
17 habitat by more than 50 percent, and continued USFS logging between 2012 and 2021 caused
18 further degradation or total loss of a large amount of this still-suitable fisher habitat. Accordingly,
19 actual population numbers today, as well as survival and recovery trajectories, are likely
20 significantly lower than in 2011.

42. The best available science concludes that for terrestrial mammals like the Pacific
fisher, the minimum viable population size to avoid a significant risk of extinction over several
decades is 3,876 individuals. *See* L.W. Traill et al., “Minimum viable population size: a meta-
analysis of 30 years of published estimates,” *Biological Conservation* 139: 159-166 (2007). This
conclusion is based on a massive meta-analysis of 95 scientific studies spanning three decades.
Accordingly, even if the upper estimate of 500 individual SSN fishers in 2011 was accurate at that
time and even if the subsequent loss of suitable habitat did not reduce the population, the
estimated population is 87 percent lower than the minimum viable population needed to avoid a

1 significant risk of extinction in the near future. If the true current population size is closer to 100
2 to 200 individuals, including juveniles and subadults, the population is 95 to 97 percent lower than
3 the minimum viable population.

4 43. Concerned members of the public have attempted for decades to obtain ESA
5 protection for the Pacific fisher. In 1990, over a dozen organizations petitioned FWS to list the
6 Pacific fisher as an endangered species, but FWS denied that petition. 56 Fed. Reg. 1159 (Jan. 11,
7 1991). Three years later, other organizations again petitioned to list the species as threatened, and
8 FWS again denied the petition, but conceded that “available information indicates that fishers have
9 experienced declines in the past, and may be vulnerable to the removal and fragmentation of
10 mature/old-growth habitat and incidental trapping pressure.” 61 Fed. Reg. 8016-17 (Mar. 1,
11 1996). Following litigation by concerned citizens, FWS finally agreed in 2004 that listing of the
12 species was “warranted” under the ESA listing criteria, but “precluded” by the agency’s higher
13 listing priorities. 69 Fed. Reg. 18,770 (Apr. 18, 2004). For the next nine years, FWS continued to
14 make the same “warranted but precluded” determination annually. *See* 79 Fed. Reg. 60,419,
15 60,423 (Oct. 7, 2014).

16 44. After further litigation, FWS finally proposed to list the Pacific fisher (using the
17 nomenclature “West Coast fisher”) as a “distinct population segment” in 2014. 79 Fed. Reg.
18 60,419 (Oct. 7, 2014). The proposed listing explained that “[f]isher populations are fragmented
19 and greatly reduced from their historical range in the West Coast DPS area.” *Id.* at 60,428. FWS
20 identified “the main threats to the West Coast DPS” as “habitat loss from wildfire and vegetation
21 management; toxicants (including anticoagulant rodenticides); and the cumulative and synergist
22 effects of these and other stressors acting on small populations.” *Id.* at 60,420. FWS further
23 explained that “researchers have identified the greatest long-term risk to fishers as the isolation of
24 small populations and the higher risk of extinction due to stochastic events.” *Id.* at 60,434.
25 Finally, FWS indicated that “[f]or the habitat-related stressors, the cumulative and synergistic
26 impacts are particularly problematic in the SSN because of the narrow band of habitat that
27 comprises SSN and its small population size.” *Id.* at 60,435.

28

1 45. Between 2012 and 2016, agency and other biologists developed a “Southern Sierra
 2 Nevada Fisher Conservation Strategy” to guide the conservation and recovery of the Pacific fisher
 3 in the Southern Sierra Nevada based on available fisher population and habitat vegetation data.
 4 Finalized in February 2016, this Conservation Strategy was built primarily around increasing the
 5 carrying capacity within seven identified fisher core habitat areas and increasing dispersal
 6 potential between these core areas (through six identified linkage areas) to facilitate the
 7 reproductive success and expansion of the population. The Conservation Strategy defined core
 8 areas as large “contiguous areas of fisher habitat within which fishers can establish home ranges
 9 and comingle as a population, generally separated by unsuitable habitat areas.” It further
 10 explained that “[w]ithin core areas, fishers need foraging, resting, and denning habitats, of which
 11 denning habitat is most limited. Dispersal habitat in linkage areas facilitates inter-core
 12 movements.”

13 46. In March 2016, FWS issued a Final Species Report for the SSN Fisher which
 14 affirmed, among other things, that the most critical limiting factor for fishers is the availability of
 15 suitable habitat elements to provide for successful reproduction and rest sites. FWS, “Final
 16 Species Report, Fisher (*Pekania pennanti*), West Coast Population” at 90 (Mar. 2016). Such
 17 denning and resting habitat occurs in low- to mid-elevation coniferous and mixed conifer and
 18 hardwood forests with characteristics of mid- and late-successional forests, including diverse
 19 successional stages, moderate to dense forest canopies, large-diameter trees, coarse downed wood,
 20 and singular features of large snags, tree cavities, and deformed trees. 85 Fed. Reg. at 29,538.
 21 Many scientific studies confirm the fact that available denning and resting habitat a limiting factor
 22 for the species and that such habitat may take decades or centuries to develop.

23 47. Despite the small size of the SSN fisher population and the ongoing loss of its
 24 suitable habitat, FWS abruptly and inexplicably reversed course in 2016 and withdrew the
 25 proposed listing of the “West Coast” fisher. 81 Fed. Reg. 22,710 (Apr. 18, 2016). Several
 26 conservation organizations challenged that decision, and a federal court subsequently found it to
 27 be arbitrary, capricious, and unsupported by the evidence. *See Ctr. For Biological Diversity v.*
 28

1 *U.S. Fish and Wildlife Serv.*, 342 F. Supp. 3d 968 (N.D. Cal. 2018) (ordering FWS to produce a
 2 new listing decision by March 22, 2019).

3 48. In 2019, FWS complied with the court order by reinstating its earlier proposal to
 4 list the “West Coast Distinct Population Segment” of the fisher as a “threatened” species. 84 Fed.
 5 Reg. 60,278 (Nov. 7, 2019). In this proposed rule, FWS stated that that SSN fisher population
 6 consisted of “a low of 100 to a high of 500 individuals,” but explained that these estimates were
 7 “based on habitat conditions for fishers in the Sierra Nevada that predate the ongoing, large-scale
 8 tree mortality event in this geographic area that began in approximately 2010.” *Id.* at 60,286.
 9 FWS further explained that the tree mortality event “is affecting many of the key components of
 10 fisher habitat such as complex forest canopy structure and connected closed-canopy forest
 11 conditions.” *Id.* As these statements demonstrate, the SSN fisher population estimates based on
 12 habitat conditions from 2011 and before do not accurately reflect current conditions or population
 13 numbers.

14 49. In February 2020, many of the scientists who had developed the 2016 Conservation
 15 Strategy issued a new “Southern Sierra Nevada Fisher Conservation Strategy Interim
 16 Recommendations” document in the wake of the recent dramatic landscape changes. That
 17 document noted that “[i]mplementing the fisher conservation strategy was immediately derailed
 18 by this dramatic shift in habitat conditions as well as by the lack of an updateable vegetation
 19 database for planning conservation actions and monitoring habitat changes due to forest
 20 management and other factors.” Interim Recommendations at 4. This document concluded that
 21 persistence of the SSN fisher “is now at elevated risk due to recent habitat changes and increased
 22 population fragmentation that appears evident following the recent drought-related tree mortality
 23 and high-intensity wildfires.” *Id.* at 6. USFS has often exacerbated these risks by further habitat
 24 removal due to post-disturbance logging and clearcutting.

25 50. The Interim Recommendations provided, for the first time, some preliminary
 26 evaluation of habitat changes over the first half of the 2010 decade. The document stated that
 27 “[w]hile we do not yet have complete post-drought vegetation information, the limited sources
 28 available suggest that almost 40% of the foraging habitat in the fisher conservation area has been

1 lost through the cascading effects of drought, insect infestation, fire, and subsequent tree mortality.
2 . . Possibly more significant than simple acreage, the number of habitat patches went from 74 to
3 558 and the average patch size went from over 31,500 acres to 2,600 acres . . . , indicating severe
4 fragmentation. . . . These estimates do not include fires or other disturbances that occurred after
5 2016, such as the Railroad Fire.” Interim Recommendations at 8-9.

6 51. With respect to critical denning habitat, the Interim Recommendations document
7 stated that “[a] similarly dramatic loss has likely occurred in the highest quality habitat,
8 characterized as high-quality denning habitat in the assessment area. Prior to the widespread tree
9 mortality observed between 2014 and 2016, the [Conservation Strategy] estimated that 805,000
10 acres . . . of denning habitat existed in the southern Sierra Nevada. Using the same model
11 parameters with updated (2016) canopy cover data, we now estimate that 493,000 acres . . .
12 remain, a loss of 39%. The number of denning habitat patches has dropped from 254 to 172, and
13 the average size of these patches has dropped from 3169 acres to 2868 acres. Essentially, this
14 translates to a loss of many of the smaller patches and a shrinking of the larger ones . . . Further
15 analysis will be necessary to refine our understanding of these trends, once updated and complete
16 vegetation data are available effects of drought, insect infestation, fire, and subsequent tree
17 mortality.” *Id.* at 9.

18 52. The Interim Recommendations concluded that due to the “extreme habitat loss and
19 fragmentation that occurred between 2014 and 2016, the landscape no longer reflects” the pattern
20 of seven core areas and six key linkages identified in the 2016 Conservation Strategy. *Id.* at 10.
21 In particular, “[c]ore areas have been fragmented and shrunk, and former linkage areas may now
22 represent barriers to movement.” *Id.* The authors explained that “[f]urther analysis will be
23 necessary . . . once updated and complete vegetation data are available.” *Id.*

24 53. With respect to linkage corridors, the Interim Recommendations concluded that
25 “given the higher level of habitat fragmentation, finding suitable territories by dispersing female
26 fishers is more uncertain” and recommended that “a detailed population viability analysis designed
27 to identify critical core areas, corridors, and restoration opportunities” should guide future
28 conservation of the species. *Id.* at 22.

1 54. On May 15, 2020, FWS issued a final decision, listing the SSN fisher as a distinct
2 population segment (“DPS”) of the Pacific fisher based on its geographic isolation and genetic
3 uniqueness and determining that the SSN fisher meets the definition of “endangered” species
4 (rather than a “threatened” species as previously proposed), meaning that the DPS is “in danger of
5 extinction throughout all or a significant portion of its range.” *See* 85 Fed. Reg. 29,532 (May 15,
6 2020).

7 55. In reaching its final listing decision, FWS stated that “[o]f particular significance . .
8 . were loss and fragmentation of habitat resulting from high-severity wildfire and wildfire
9 suppression (i.e., loss of snags and other large habitat structures on which the species relies),
10 climate change, and tree mortality from drought, disease, and insect infestations.” 85 Fed. Reg. at
11 29,532. Also of significance were “threats related to potential direct impacts to individual fishers
12 (e.g., increased mortality, decreased reproductive rates, increased stress/hormone levels,
13 alterations in behavioral patterns).” *Id.* FWS concluded that “[t]hese factors are resulting in a
14 cumulative effect to such a degree that the best available information indicates the Southern Sierra
15 Nevada DPS of fisher meets the definition of an endangered species.” *Id.*

16 56. The May 2020 listing decision explained that small populations like the SSN fisher
17 are vulnerable to a rapid decline in their numbers and to localized extinction due to three factors:
18 (1) loss of genetic variability (e.g., inbreeding depression, loss of evolutionary flexibility); (2)
19 fluctuations in demographic parameters (e.g., birth and death rates, population growth rates,
20 population density); and (3) environmental stochasticity or random fluctuations in the biological
21 (e.g., predation, competition, disease) and physical (e.g., wildfire, drought events, flooding)
22 environment. 85 Fed. Reg. at 29,545. According to FWS, the SSN fisher exhibits all three of
23 these small population vulnerabilities, including (1) loss of large contiguous areas of historical
24 habitat, including a 39 percent loss of its habitat over the past five years, in combination with
25 restriction of the species to forested habitats that have been lost or modified due to timber-harvest
26 practices, large, high-severity wildfires whose frequency and intensity are in turn influenced by
27 the effects of climate change, and increasing forest fuel density from fire suppression and a lack of
28 low-severity fire over the recent long term; (2) dependence on specific elements of forest structure

1 that may be limited on the landscape, including microsites for denning and resting; and (3)
2 susceptibility to injury or mortality due to predation from co-occurring larger predators. *Id.* at
3 29,566-67. “Each of these vulnerabilities may separately, or together, influence the magnitude of
4 other threats.” *Id.*

5 **B. Issuance of Programmatic Biological Opinion and Incidental Take Statement**

6 57. The listing of the SSN fisher on May 15, 2020 required USFS to engage in
7 consultation with FWS for projects that may affect the species. On May 19, 2020, USFS initiated
8 consultation with FWS, initially for 40 already-approved projects, and provided a Programmatic
9 Biological Assessment (“2020 PBA”). The 2020 PBA stated that the current range of the Pacific
10 fisher represents a 50 percent reduction from the presumed historical range and that the current
11 SSN fisher population “almost certainly numbers <500 total individuals (Spencer et al. 2011) and
12 probably <300 adult fishers and has been stable over the past decade based on occupancy
13 estimates from the regional monitoring program (Zielinski et al. 2013a, Zielinski and Gray 2018).”
14 2020 PBA at 16. USFS’s analysis and conclusions in the 2020 PBA were based on the population
15 and trend assumptions contained in these statements.

16 58. The “Spencer et al. 2011” study referenced in the 2020 PBA is titled “Using
17 occupancy and population models to assess habitat conservation opportunities for an isolated
18 carnivore population.” This study assessed SSN fisher population status using “a spatially explicit
19 population model coupled with a fisher probability of occurrence model.” The study authors used
20 fisher survey data collected between 2002 and 2006 and existing (pre-2011) habitat/vegetation
21 estimates as inputs into the fisher occurrence model. They concluded that the SSN carrying
22 capacity – the population size that an environment can support – is between 73 and 147 adult
23 females. Assuming a 1:1 adult sex ratio, the authors estimated an adult population of 146 to 294
24 individuals, but concluded that “this probably over-estimates the number of males.” The result of
25 this modeling evaluation accorded reasonably well with the author’s extrapolation of 53 to 83
26 adult females from another marking study. The authors noted that their simulation results “were
27 run on a static habitat map” and that, “[i]n reality, vegetation, habitat value, and carrying capacity
28 are dynamic due to succession, fires, and other factors.” For this reason, subsequent events that

1 reduce habitat value, like those that occurred after 2011, will affect population and carrying
2 capacity.

3 59. The authors of Spencer et al. 2011 also explained that “[t]otal above-ground
4 biomass of trees was the strongest biotic predictor of fisher habitat value in our models . . . and it
5 should correlate closely with forest structure variables found by numerous field studies to predict
6 fisher habitat election at fine scale: large trees, dense, multi-storied canopies, and abundant dead-
7 wood structures.” Thus, “disturbances that decrease forest biomass or fragment areas of high
8 biomass will have adverse effects on fishers.” While “total tree biomass tends to be a good
9 predictor of fisher habitat quality,” “[v]egetation management that promotes accumulation of
10 forest biomass but removes important constituent elements, such as dead-wood structures,
11 deformed trees, or trees with cavities may be detrimental in ways our landscape-scale correlation
12 model cannot account for.”

13 60. The “Zielinski et al. 2013a” study referenced in the 2020 PBA is titled “Estimating
14 Trend in Occupancy for the Southern Sierra Fisher *Martes pennanti* Population.” The authors of
15 this study indicate that the size of the SSN fisher population “is unknown, but various estimates
16 have ranged from 100 to 400 individuals (Lamberson et al. 2000; Spencer et al. 2011). This small
17 number is of concern, especially because the population is effectively isolated from the nearest
18 population in northwestern California.” The Zielinski et al. 2013a study is a monitoring
19 occupancy study that sampled for the presence or absence of SSN fishers at 233 core sites,
20 although for financial and logistical reasons, not every site was monitoring every year; on average,
21 139.5 sites were sampled each year and the average site was sampled 5 of the 8 years. Sampling
22 “was designed to detect at least a 20% decline . . . in the first 10 [years] of sampling (equivalent to
23 a 2.45% annual decrease).” As the authors explained, “[t]he methods to detect presence or
24 absence of fishers can be used to determine geographic distribution and occupancy, but they do
25 not directly measure abundance or provide estimates of reproduction or survival.” Thus, the
26 study’s conclusions are premised on “the key assumption that changes in occupancy reflect
27 changes in population size.”

28

1 61. Given the study design, Zielinski et al. did not set out to provide and did not
2 provide any evidence or results that estimate population size or survival. Instead, the authors
3 reported “the results of 8 [years] of sampling and analysis to determine occupancy and trends in
4 occupancy for fishers in the southern Sierra Nevada from 2002 to 2009.” Using a “best fit”
5 approach, the authors concluded that the data “revealed no evidence for a change or trend in fisher
6 occupancy estimates over the 8-y period.” While one area showed a downward trend, it was not
7 statistically significant. For this reason, the authors concluded that “we have no evidence that the
8 fisher population, as indexed by our measure of occupancy, has changed in the southern Sierra
9 Nevada, or any zone therein, from 2002 to 2009.” Thus, this study measured occupancy trends
10 prior to 2010 and provides no evidence of population size, occupancy, or persistence today, after a
11 decade in which vital fisher denning and resting habitat has been reduced by more than 50 percent.

12 62. The “Zielinski and Gray 2018” study referenced in the 2020 PBA is titled “Using
13 routinely collected regional forest inventory data to conclude that resting habitat for the fisher
14 (*Pekania pennanti*) in California is stable over ~20 years.” The authors explained that cavities or
15 chambers in large live and dead trees provide resting habitat this is “considered one of the critical
16 elements for the maintenance and of fisher populations” and noted that “these features may take
17 hundreds of years to develop.” Accordingly, “there is a premium on information about the amount
18 and distribution of resting habitat because it can be degraded at a much higher rate than it
19 develops.” This study was designed, therefore, to test the efficacy of using Forest Inventory and
20 Analysis vegetation data to predict fisher resting habitat – but notably, not denning habitat – in the
21 southern Sierra Nevada and northwestern California. Using three data sets with mean assessment
22 years of 1998, 2003, and 2010, the study found no overall change in resting habitat over this
23 period in the southern Sierra Nevada, although the Sierra and El Dorado National Forests
24 experienced a decrease and the Sequoia and Stanislaus National Forests experienced an increase.

25 63. In discussing these modeling results, Zielinski and Gray stated that the use of a
26 surrogate feature, like fisher resting habitat, is of interest to ecologists as a way to predict
27 population status, and they hypothesized that, “other things being equal,” if resting habitat is
28 “stable and sufficiently abundant,” the fisher population in the same area “should also be stable, or

1 at least not decreasing.” The authors caveated their hypothesis by explaining that “[o]f course
2 factors other than resting habitat affect fisher population growth rates . . . so stability in [resting
3 habitat] over time doesn’t guarantee that the fisher population will necessarily be spared negative
4 effects nor enjoy positive effects. . . . A stable or increasing trend in resting habitat is a necessary,
5 but not sufficient, condition for determining the health of a fisher population.”

6 64. As demonstrated in the foregoing paragraphs, the studies cited in the 2020 PBA do
7 not reflect or support the SSN fisher population estimates or trend conclusions stated in the 2020
8 PBA. The cited studies rely on presence-absence surveys and predictive modeling based on
9 habitat conditions that predate the dramatic denning/resting habitat reductions from drought,
10 beetles, logging, and wildfires that began in 2012 and continued through 2021. Given the
11 reduction of over 50 percent of the suitable SSN fisher denning/resting habitat on national forests
12 during the last decade, the outdated habitat data used in these studies does not and cannot
13 accurately measure current population status or predict current survival and recovery trajectories.

14 65. Nevertheless, less than a month after the 2020 PBA was produced, FWS issued a
15 Programmatic Biological Opinion (“2020 PBO”) and an addendum that covered all 40 initial
16 USFS projects, authorizing incidental take on five of those projects. A month and a half later,
17 FWS issued a second addendum authorizing another five projects under the 2020 PBO, bringing to
18 45 the total number of USFS projects authorized through concurrence or consultation. FWS
19 estimated that as a result of USFS logging and vegetation management activities on the Sierra
20 National Forest, it was reasonably likely that four female adult fishers will be unable to
21 successfully reproduce for one denning season and eight kits will be injured or killed due to den
22 abandonment or increased susceptibility to predation. Even though many of the projects will be
23 implemented during successive denning seasons, in some cases for up to five total years, FWS did
24 not estimate the resulting take of fishers from USFS logging and vegetation management activities
25 beyond one denning season.

26 66. In the 2020 PBO, FWS repeated verbatim the SSN fisher population estimates and
27 supporting studies cited in the 2020 PBA, but then added the critical caveat that “[t]hese estimates
28 predate the 2012-2015 drought and subsequent habitat loss. An updated population estimate has

1 not been completed; therefore, it is unknown if there have been subsequent changes in the
 2 population.” 2020 PBO at 29.

3 67. The denning season for the SSN fisher generally runs from March 1 through June
 4 30, during which the Forest Service normally implements a Limited Operating Period (“LOP”)
 5 when vegetation management activities are prohibited. Under the 2020 PBO, FWS authorized
 6 incidental take during the normal LOP for five projects, permitting USFS to take twelve fishers
 7 during that period, including four adult females and eight fisher kits that will not survive.

8 68. The 2020 PBO and two addenda also authorized 40 additional logging or
 9 vegetation management actions that may affect the SSN fisher on the Sierra, Sequoia, and
 10 Stanislaus National Forests, concurring with USFS’s assertions that these activities are not likely
 11 to adversely affect the fisher. FWS provides little, if any, additional supporting analysis to reach
 12 its determination and concurrence on these 40 projects.

13 **C. Large Fires on the Sierra and Sequoia National Forests During 2020**

14 69. Subsequent to issuance of the 2020 PBO and the addended 45 USFS projects, the
 15 Creek Fire ignited in late summer 2020 and burned roughly 379,895 acres in the Sierra National
 16 Forest (<https://inciweb.nwcg.gov/incident/7147/>), including tens of thousands of acres of SSN
 17 fisher habitat, much of which is considered core denning, resting, and foraging habitat.

18 70. The SQF Complex Fire (or Castle Fire) also ignited in the summer of 2020 and
 19 burned roughly 174,178 Acres in the Sequoia National Forest and Sequoia National Park
 20 (<https://inciweb.nwcg.gov/incident/7048/>), including tens of thousands of acres of SSN fisher
 21 habitat, much of which is considered core denning, resting, and foraging habitat.

22 71. To conserve the SSN fisher, the 2016 Conservation Strategy identified seven core
 23 habitat areas for protection. Scientists believe that core areas 1, 2, 3, 4, and 5 are occupied by
 24 female fishers, while core areas 6 and 7 constitute suitable but currently unoccupied habitat. The
 25 2020 fires burned in all five occupied SSN fisher core habitat areas 1, 2, 3, 4, and 5.

26 72. The 2016 Conservation Strategy also identified six linkage areas that connect the
 27 seven core areas and allow SSN fisher dispersal. The 2020 fires burned through these linkages,
 28 potentially inhibiting or reducing fisher movement between these cores. The Creek Fire burned

1 through the linkage areas between Cores 4 and 5 in the Sierra National Forest, and the Sequoia
2 Complex/Castle Fire burned through the linkages between Cores 1 and 3 and Cores 2 and 3 in the
3 Sequoia National Forest. The compound effects from the 2020 fires and the 2015 Rough Fire on
4 fisher movement between core areas is unknown and has not been assessed by USFS or FWS.

5 73. After some discussion between Plaintiffs and Defendants regarding the impacts of
6 these massive 2020 fires and the intent of USFS to proceed with the 45 authorized projects,
7 Plaintiffs sent a notice to Defendants of their intent to pursue a citizen suit under ESA section
8 1540(g) if Defendants did not reinitiate consultation in light of dramatic wildfire-caused landscape
9 changes to SSN fisher habitat that were not previously considered in the 2020 PBO.

10 74. On February 23, 2021, USFS issued an “Amendment to the Programmatic
11 Biological Assessment for the Southern Sierra Nevada DPS of Pacific Fisher” (“2021 PBA”).
12 Applying something called “Rapid Assessment of Vegetation Condition after Wildfire” to analyze
13 the potential effects of the fires on fisher habitat, USFS concluded in the 2021 PBA that the 2020
14 wildfires reduced SSN fisher denning habitat by roughly 14 percent and foraging habitat by
15 roughly 15 percent. Using data from the California Wildlife Habitat Relationship system, the
16 2021 PBA concludes that only 203,845 acres of denning habitat and 195,820 acres of foraging
17 habitat remain on the Sierra and Sequoia National Forests, which collectively include 2,580,618
18 acres. *Id.* at 4. The 2021 PBA does not contain any new population monitoring data or viability
19 analysis. The 2021 PBA also continues to ignore or underestimate the impact of post-fire logging by
20 inaccurately assuming zero impacts to fishers from the logging, contrary to the best available
21 science, which concludes that burned areas are often selected by fishers for foraging in the absence
22 of logging and that logging removes such habitat.

23 75. On February 24, 2021, USFS sent a letter to FWS requesting “to reinitiate
24 consultation to update the baseline existing conditions in order to address changes resulting from
25 the two wildfires that occurred within the [SSN fisher habitat] during the 2020 fire season.”
26 Despite the dramatic reduction in SSN fisher habitat described in the 2020 Interim
27 Recommendations and the additional reduction in habitat described in the 2021 PBA as a result of
28 the 2020 fires, USFS stated in this letter that “we believe that the changes to the baseline caused

1 by these fires are not so significant as to legally require re-initiation of consultation. . . .
2 Nonetheless, we have decided to reinstitute consultation in an abundance of caution and so that the
3 [Programmatic Biological Assessment and Programmatic Biological Opinion] reflect the latest
4 information.”

5 76. On March 12, 2021, FWS issued a revised Programmatic Biological Opinion
6 (“2021 PBO”) in response to USFS’s request to reinstitute ESA consultation. The analysis in the
7 2021 PBO is “based largely on California Wildlife Habitat Relationships” system, the core of
8 which is a database that relates species to each supporting habitat type. FWS described these data
9 as “imperfect at best,” but “the only consistent vegetation information currently available across
10 the fisher’s range.” *Id.* at 10. The 2021 PBO then repeats verbatim the outdated statements from
11 the 2020 PBA and the 2020 PBO about the status of the SSN fisher population based on pre-2011
12 habitat information, but again confirms that “an updated population has not been completed;
13 therefore, it is unknown if there have been subsequent changes in the population.” *Id.* at 32.

14 77. The scientific studies cited by the 2021 PBO do not cite current or updated
15 population estimates that take account of the dramatic reduction in SSN fisher habitat over the past
16 decade, and the 2021 PBO itself does not contain any new population monitoring data or viability
17 analysis.

18 78. The 2021 PBO suggests that actual monitoring for SSN fishers on the Sierra
19 Nevada National Forests, which began in 2002, continues regardless of current perceived habitat
20 suitability. *Id.* at 37. Plaintiffs are informed and believe, and on that basis allege, that funding for
21 at least some of this monitoring has been discontinued.

22 79. In evaluating the effects of the action, the 2021 PBO concedes that logging and
23 other USFS vegetation management activities disrupt fisher breeding and foraging behavior and
24 reduce habitat quality, resulting in loss of denning habitat and reproductive success, increased
25 exposure to predation and decrease in prey, and adverse effects on the species’ ability to travel
26 distances between safe sites. FWS suggests, however, that these adverse “short-term” effects may
27 be countered by “potential positive effects” from “vegetation management” that “can increase
28 resilience of large tree clumps within and adjacent to high value habitat.” *Id.* at 40. The 2021

1 PBO does not cite any scientific evidence to support this speculative theory about long-term
2 positive effects, and none exists.

3 80. With respect to effects of proposed USFS projects on recovery, the 2021 PBO
4 repeats the same speculative and scientifically unsupported theory that “[w]hile some of the USFS
5 projects appended to this Programmatic Biological Opinion may result in short-term impacts to
6 fisher (through habitat modification or noise disturbance, for example), we expect that these short-
7 term impacts are outweighed by the long-term benefits of these projects,” which FWS describes as
8 “increasing resilience of fisher denning, foraging, and dispersal habitat.” *Id.* at 47. The 2021 PBO
9 does not cite any scientific evidence to support this speculative theory about long-term positive
10 effects, and none exists.

11 81. Moreover, this speculative theory does not account for important aspects of the
12 wildfire issue. The science shows that “fuel reduction treatments” that create openings in the
13 canopy and/or reduce forest canopy actually increase forest temperatures, reduce forest moistures,
14 increase fresh-oxygen availability and reduce wind resistance in the forest-fire zone, thereby
15 potentially increasing fire intensity, severity, and spread.

16 82. For example, recent work by A.L. Atchley et al., “Effects of fuel spatial
17 distribution on wildland fire behavior,” *Int’l Journal of Wildland Fire* (2021) demonstrates that
18 fuels-reduction practices that fail to properly consider atmospheric motions induced by fire, like
19 those proposed by USFS and relied on by FWS in the 2020 and 2021 PBOs, can actually reduce
20 resiliency, contrary to USFS claims. By neglecting the role that fire-induced buoyancy plays in
21 replenishing fresh oxygen and driving local winds, the unproven USFS theory about fuel treatment
22 and vegetation management creating long-term forest resiliency is incomplete, ignores basic
23 physics, and is potentially dangerous. *See, e.g.*, J.L. Coen et al., “Computational modeling of
24 extreme wildland fire events: a synthesis of scientific understanding with applications to
25 forecasting, land management, and firefighter safety,” *Journal of Computational Science*
26 (2020). Numerous additional studies, including the largest scientific analysis of this question ever
27 conducted (spanning the entire western US, and analyzing three decades of data, *i.e.*, Bradley et
28 al., “Does increased forest protection correspond to higher fire severity in frequent-fire forests of

1 the western United States?” Ecosphere (2016)), provide further support to the conclusions of
 2 Atchley et al., and similarly find that logging activities, including commercial thinning and post-
 3 fire logging, tend to increase, not decrease, fire severity. This research has been ignored by USFS
 4 and FWS in their PBA and PBO assessments.

5 83. Despite the reduction of nearly 55 percent of suitable SSN fisher habitat on national
 6 forest lands since the last habitat-based population estimates were developed, and despite the
 7 absence of any new population evaluation or analysis, the 2021 PBO concluded that proposed
 8 USFS actions across the range of the SSN fisher DPS are “not likely to jeopardize the continued
 9 existence of [the species]” and that the “project-related effects to the species, when added to the
 10 environmental baseline and analyzed in consideration of all potential cumulative effects, will not
 11 rise to the level of precluding recovery or reducing the likelihood of survival of the species.” *Id.* at
 12 47-48. This conclusion is based ostensibly on “conservation measures” intended to avoid direct
 13 injury, avoid denning season, and protect historically known and potential den trees; the small
 14 percentage of USFS lands on which these projects will occur; the “long-term beneficial effects” of
 15 logging and other vegetation management on fishers; and continued monitoring fisher distribution
 16 and trend information. *Id.* The 2021 PBO does not cite any scientific evidence for its reliance on
 17 “long-term beneficial effects” of logging and vegetation management to offset habitat destruction
 18 or to support its statement about “continued monitoring” will ensure fisher recovery. And it does
 19 not explain how temporal measures designed to avoid direct fisher injury during logging and other
 20 management activities that destroy crucial habitat will adequately protect the survival and
 21 recovery of the species under the habitat conditions that exist today.

22 84. Although the 2021 PBO references “USFS projects appended to this Programmatic
 23 Biological Opinion,” no USFS projects are appended or independently considered, and as the 2021
 24 PBO itself states, “[n]o incidental take is authorized by this programmatic biological opinion for
 25 the DPS of the fisher.” *Id.* at 49. Accordingly, Plaintiffs are informed and believe, and on that
 26 basis allege, that USFS has no ESA concurrence or take authorization under the 2021 PBO to
 27 carry out any project in SSN fisher habitat.

28

1 **D. USFS Projects that May Affect the SSN Fisher**

2 85. For the five logging and vegetation management projects that USFS determined in
 3 the 2020 PBO are likely to adversely affect the SSN fisher, FWS authorized the incidental take of
 4 12 fishers through loss or alteration of denning and foraging habitat during the fisher LOP. Table
 5 below identifies these five projects, with hyperlinks to the 2020 project biological assessments:

6 **Table 1. Projects with Incidental Take of 12 Fishers Authorized by FWS**

Forest	Project Name	Activities	Project Acres*	Fisher Acres Impacted *
Sierra	Ferguson Fire Roadside Hazard Tree Removal Project	Hazard tree logging, follow-up prescribed burning	1500	327
Sierra	Railroad Fire Restoration	Hazard tree logging, follow-up pile burning	1250	317
Sierra	Sky Ranch Road System Hazard Tree Abatement Project	Logging of remaining 13,000+ hazard trees	3241	1983
Sierra	Sonny Meadows North and South Project 2018	Precommercial thinning, hazard tree logging, prescribed burns	2278	2194
Sierra	Musick Vegetation Project	Variety of vegetation treatments, including hazard tree logging	13238	7171

15 ***Source of Acresages: PBO Appendage 1 at 5-6.**

16 86. USFS recently informed Plaintiffs that the Railroad Fire and Sky Ranch projects
 17 have been completed.

18 87. During June and July 2020, FWS appended 40 additional projects to the 2020 PBO.
 19 For these 40 projects, FWS concurred with USFS that the projects may affect, but are not likely to
 20 adversely affect the SSN fisher. FWS did not authorize any USFS activities on these projects
 21 during the fisher LOP, but would allow the loss or alteration of fisher denning and foraging
 22 habitat. Tables 2a and 2b below identify these 40 projects, with hyperlinks to 2020 project
 23 biological assessments or other project files where those were unavailable:

24 **Table 2a. Projects that May Affect Fishers – Sequoia National Forest
 25 and Giant Sequoia National Monument (GSNM)**

Forest	Project Name	Activities	Project Acres*	Fisher Acres Impacted*
Sequoia	Eshom Ecological Restoration Project	Logging, mechanical treatments, and prescribed fire	5019	1019

Forest	Project Name	Activities	Project Acres*	Fisher Acres Impacted*
Sequoia	Joey Healthy Forest and Fuels Reduction Project	Commercial and hand thinning, hazard tree logging, pile and prescribed burning	6193	698
Sequoia	North Road Hazard Tree Abatement	Hazard tree logging, chipping, piling, and burning	8980	5047
Sequoia	Pier Fire Roadside Hazard Tree Mitigation	Hazard tree logging, mastication, chipping, piling, and burning	1636	1151
Sequoia	Road 25S15 Hazard Tree Project	Hazard tree logging, mastication, chipping, piling, and burning	576	118
Sequoia	Slick Rock Thin and Prescribed Burn Project	Broadcast and/or piling and jackpot burning, incidental hazard tree felling	896	861
Sequoia	Summit Healthy Forest	Hazard tree logging, chipping, piling, and burning	673	469
Sequoia	Trail of 100 Giants Hazard Tree Mitigation Project	Hazard tree logging, pile burning, chipping	30	30
Sequoia/GSNM	Big Stump/ Redwood Mountain Fuels Restoration	Prescribed fire, hand thinning, fire line construction, pile burning	3073	2485
Sequoia/GSNM	Bull Run Roadside Hazard Tree Mitigation	Hazard tree logging, pile burning, chipping	3245	633
Sequoia/GSNM	Hazard Tree Slash Clean-up Project	Removing previously felled material through piling and burning, as biomass, or as wood products	1789	654
Sequoia/GSNM	Kirkland Plantation Thin Project	Mastication and prescribed fire	504	119
Sequoia/GSNM	Long Meadow Restoration Project	Install plug structures, rock and vegetation, plant native vegetation	35	35
Sequoia/GSNM	McKenzie Ranch Project Prescribed Burning	Prescribed fire, hand line construction/maintenance, hazard tree felling	500	431
Sequoia/GSNM	Revised Frog Project (Frog II Project)	Fuel reduction/ commercial thinning, hazard tree logging	1258	833
Sequoia	Ponderosa Fuel Reduction Urban Interface Project	Pile burning	1079	775
Sequoia	Spear Creek Roadside Hazard Tree Mitigation Project	Hazard tree felling, fuel mitigation (removing branches and some downed material), chipping, and piling and burning	1200	633
Sequoia	2011 Revision 1 to the 1998 Revised	Thinning (hand and mechanical), excavator or hand piling slash,	2340	601

Forest	Project Name	Activities	Project Acres*	Fisher Acres Impacted*
	Ice Timber Sale and Fuels Reduction Project	prescribed burn (understory broadcast, jackpot, and pile burn)		
Sequoia	Rough Plantation Maintenance and Restoration Project	Biomass removal, hand thinning, mechanical thinning, hazard tree removal, piling/burning, prescribed fire, and tree planting	5386	194

*Source of Acreages: Biological Assessment Project Forms, see hyperlinks

Table 2b. Projects that May Affect Fishers – Sierra National Forest

Forest	Project Name	Activities	Project Acres	Fisher Impact Acres
Sierra	Cedar Valley Fuels Reduction Project	Hand and mechanical thinning, hazard tree logging, prescribed burning, fuelbreak maintenance	1210	121
Sierra	French Fire Recovery and Reforestation	Mechanical and hand thinning dead trees, pile burning, planting	3500	2062
Sierra	Graveyard of the Giants Trail Hazard Abatement	Hazard tree removal via hand thinning	1366	560
Sierra	Grey's Mountain Ecological Restoration Project	Commercial thinning, hazard tree logging, mastication, piling, pile and prescribed burning	9581	5169
Sierra	Pinegrove Project	Hand and mechanical thinning, hazard tree logging, mastication, prescribed burning	677	88
Sierra	Sugar Pine Adaptive Management	Forest health and commercial thinning (link to old project website, Batch 1 BA not avail.)	5416	?
Sierra	Upper Chiquito Creek Bridge Replacement	Road maintenance, road paving, and bridge replacement	18.5	0
Sierra	Whiskey Ridge Ecological Restoration Project	Commercial and hand thinning, hazard tree logging, prescribed burning	8263	8263
Sierra	Aspen Restoration Project	Post-fire salvage logging, hazard tree logging, fuel treatments	22350	15457
Sierra	Bald Mountain Restoration Project	Commercial and pre-commercial thinning, prescribed burning and removal of dead trees (link to decision, Batch 1 BA not available)	17360	?
Sierra	Blue Rush Restoration Project	Tree release and removal, mastication, fuelbreaks, herbicides, pile burning	4800	1500
Sierra	Dinkey North Restoration Project	Prescribed burning	1617	1122

Forest	Project Name	Activities	Project Acres	Fisher Impact Acres
Sierra	Dinkey South Restoration Project	Prescribed burning (no new BA, no link to project files)	?	?
Sierra	Eastfork Restoration Project	Hazard tree logging	5078	1916
Sierra	Exchequer Restoration Project	Commercial thinning, fuel treatments, hazard tree logging, prescribed burning	18345	7158
Sierra	FY19 Joint Chiefs Fuelbreak Project	Hazard tree logging, mechanical and hand thinning, pile burning	11354	3123
Sierra	Madera and Mariposa County Roads Hazard Abatement Project	Hazard tree logging by mechanical thinning, piling, pile burning	27761	5237
Sierra	San Joaquin Hazard Tree Abatement Project	Hazard tree logging by mechanical thinning	23000	782
Sierra	Soaproot Restoration Project	Commercial thinning and fuel treatments, mastication, prescribed burning	7000	4100
Sierra	Fish Camp Project	Thinning, plant and release, treat slash, piling, pile and underburning	1200	966
Stanislaus	North Merced Prescribed Burn	Prescribed burning (link to old project website, Batch 1 BA not available)	12000	?

*Source of Acreages: Biological Assessment Project Forms, see hyperlinks

88. USFS recently informed Plaintiffs that the Bull Run (Sequoia NF), Spear Creek (Sequoia NF), San Joaquin (Sierra NF), Soaproot (Sierra NF), Cedar Valley (Sierra NF), Madera and Mariposa County (Sierra NF) projects have been completed and that the North Road (Sequoia NF) project has been cancelled.

89. USFS also informed Plaintiffs that Slide Rock (Sequoia NF), Ponderosa (Sequoia NF), Pier Fire (Sequoia NF), Whisky Ridge (Sierra NF), Blue Rush (Sierra NF), French Fire (Sierra NF), Musick (Sierra NF), and Pinegrove (Sierra NF) projects are undergoing reevaluation for various reasons, but to the best of Plaintiffs' knowledge, USFS has not reinitiated consultation for any of these projects.

90. Plaintiffs are informed and believe, and on that basis allege, that there are other known projects which may affect SSN fishers where the USFS and FWS consulted separately or

1 have not yet consulted or completed consultation, including but not limited to the projects
 2 identified in Table 3 below:

3 **Table 3. – Other Projects that May Affect Fishers**

4 Forest	5 Project Name	6 Activities	7 Project Acres	8 Fisher Acres Impacted
5 Sequoia	6 Plateau Roads Hazard Tree Project	7 Hazard tree logging, with LOP ending May 31 (p. 11 of BA)	8 2193	9 1066
7 Sequoia	8 SQF Complex Castle Fire Roadside Hazard Tree Project	9 Hazard tree logging, mastication, piling, pile burning	10 9455	11 ?
8 Stanislaus	9 Rim Fire Recovery (no new BA, link to project files)	10 Post-fire salvage logging, hazard tree logging, mastication, piling, pile burning	11 43337	12 ?

10 * **Sources of Acreages: Project files & calculations based on road mileage, see hyperlinks.**

11 91. Plaintiffs are informed and believe, and on that basis allege, that several of the
 12 actions identified in the foregoing tables have been or will be modified by USFS in response to the
 13 recent Creek and SQF Complex/Castle Fires and can no longer meet the purpose and need of the
 14 proposed actions.

15 92. Plaintiffs are informed and believe, and on that basis allege, that many other USFS
 16 actions within SSN fisher habitat, including direct responses to the recent Creek and SQF
 17 Complex/Castle Fires such as fire suppression activities, tree felling and burning during the fire,
 18 burned area rehabilitation, hazard tree felling, and other activities, have not been the subject of
 19 ESA consultation.

20 93. As the foregoing allegations demonstrate, neither FWS nor USFS know the current
 21 size of the SSN fisher population, its long-term survival trajectory and recovery prospects, or the
 22 threshold population size below which further habitat activity would jeopardize the continued
 23 existence of the species. FWS has explicitly acknowledged these facts to Plaintiffs.

24 **E. Conservation Measures**

25 94. Especially given the extremely small size of the SSN fisher population, successful
 26 reproduction and dispersal of juveniles are critical to the species' survival and long-term recovery.
 27 To support fishers' successful reproduction and to protect fishers from predation, forest structure
 28

1 must provide both natal and maternal den and rest sites. Final Species Report at 17. After their
2 birth in the spring, fisher kits do not become mobile for about four months, after which time they
3 continue to travel with the mother fisher in her home range until they disperse into their own home
4 ranges at about one year of age; in the southern Sierra Nevada, juvenile dispersal begins in March
5 of the year following the kits' birth. *Id.* at 10, 14.

6 95. In an attempt to develop conservation measures to protect breeding fishers, USFS
7 and FWS have adopted Limited Operating Periods that extend through either May or June each
8 year. FWS and USFS have not produced any scientific study, data, information, or analysis to
9 support lifting the LOPs in May or June. Likewise, the agencies have not provided supporting
10 evidence to show that the short spring season LOPs are effective in providing sufficient mitigation
11 from noise and/or disturbance to avoid the take of fishers.

12 **F. Supplemental NEPA Review**

13 96. The USFS projects identified in Tables 1, 2a, 2b, and 3 were approved at different
14 times and subject to different levels of NEPA review. While the NEPA documentation for some
15 of these projects has been updated to reflect new information or changed circumstances, Plaintiffs
16 are informed and believe, and on that basis allege, that USFS has not undertaken supplemental
17 NEPA review for all or most of these projects to evaluate the nearly 55 percent reduction of SSN
18 fisher suitable habitat on the national forests over the last decade, and the unquantified (by USFS
19 or FWS) loss and degradation of fisher habitat due to logging of snags in drought-affected and
20 fire-affected areas.

21 97. In particular, USFS has not undertaken an adequate cumulative effects analysis for
22 its continuing or proposed discretionary logging, vegetation management, and other actions in
23 light of the dramatic and significant changes in the environmental baseline, particularly with
24 respect to the degradation or loss of fisher critical denning and resting habitat across the southern
25 Sierra Nevada national forest landscape. Accordingly, USFS has not yet adequately considered
26 and disclosed to the public the cumulative impacts, and potential alternatives to address those
27 impacts, from continued logging, vegetation management, and other disturbance activities in
28 suitable fisher habitat.

CLAIMS FOR RELIEF

First Cause of Action

Violation of ESA Section 7 for Unlawful Biological Opinion (Against Defendant U.S. Fish and Wildlife Service)

1. Plaintiffs hereby reallege and incorporate by reference, as if fully set forth herein, each and every allegation in the preceding paragraphs.

2. In issuing the 2020 Programmatic Biological Opinion/Incidental Take Statement and the amended 2021 Programmatic Biological Opinion, Defendant FWS violated, and continues to violate, section 7(a)(2) of the ESA. These Biological Opinions are legally defective in numerous ways, including but not limited to:

- a. They unlawfully fail to “use the best available scientific and commercial data available” in evaluating whether the proposed USFS projects are likely to jeopardize the existence of the SSN fisher DPS;
 - b. They unlawfully fail to evaluate the current status of the SSN fisher DPS and the appropriate environmental baseline or cumulative effects to that environmental baseline, as required by 50 C.F.R. § 402.14;
 - c. They unlawfully fail to include an actual analysis of the effects of the proposed USFS actions and activities on the SSN fisher DPS and instead speculate about effects based on inadequate data and inapposite studies;
 - e. They unlawfully fail to consider all relevant factors and entirely fail to consider important aspects of the problem, such as the fact that even the most optimistic population size estimates for the SSN fisher DPS are an order of magnitude smaller than the minimal viable population for the species;
 - f. They unlawfully rely on scientifically unsupported theories about long-term “benefits” of USFS “vegetation management” actions that are unlikely to occur, or speculative and highly uncertain, to reach the conclusion that proposed USFS actions and activities are not likely to jeopardize the continued survival of the SSN fisher DPS, even as they fail to fully consider

1 important dynamics of wildfire behavior that may affect future
2 vulnerability to such fires;

- 3 g. They unlawfully fail to provide adequate support or analysis for the
4 conclusion that the proposed USFS actions and activities will not jeopardize
5 the continued existence of the SSN fisher DPS;
6 h. They unlawfully fail to independently and meaningfully evaluate
7 the impact of USFS proposed actions and activities on the recovery of the
8 SSN fisher DPS, and they lack any supporting science for the summary
9 conclusions on recovery;
10 i. They unlawfully fail to articulate a rational connection or explanation for
11 the level of incidental take allowed; and
12 j. They unlawfully fail to formulate reasonable and prudent conservation
13 measures, including the LOP, that are adequately supported by scientific
14 evidence and sufficient to avoid take of fisher mothers and kits during the
15 full reproductive season.

16 3. In these and other ways, the 2020 Programmatic Biological Opinion/Incidental
17 Take Statement and the revised 2021 Programmatic Biological Opinion for the SSN fisher violate
18 ESA section 7(a)(2), 16 U.S.C. § 1536(a)(2), and its implementing regulations, as well as the
19 procedural requirements of the APA.

20 4. The failure of FWS to comply with its mandatory legal duties under the ESA and
21 the APA is harming the interests of Plaintiffs and their members in the conservation and long-term
22 survival of the SSN fisher and in the restoration of a healthy, interconnected ecosystem across the
23 national forest landscape in the southern Sierra Nevada. Because FWS's actions are arbitrary,
24 capricious, an abuse of discretion, unsupported by scientific evidence, and otherwise not in
25 accordance with law, they are subject to judicial review under 5 U.S.C. § 706(2).

26 **Second Cause of Action**
27 **Violation of ESA Section 7 for Failure to Reinitiate Consultation**
28 **(Against Defendant U.S. Forest Service)**

5. Plaintiffs hereby reallege and incorporate by reference, as if fully set forth herein, each and every allegation in the preceding paragraphs.

6. Although Defendant USFS purported to reinitiate programmatic consultation on its ongoing and proposed projects throughout the Sierra and Sequoia National Forests following the 2020 wildfires, it has not received concurrence from FWS that the logging and other vegetation management projects are not likely to adversely affect SSN fishers or incidental take authorization from FWS that the projects are not likely to jeopardize the continued existence of the species.

8 7. Accordingly, before USFS or its contractors may move forward with any project
9 that may affect the SSN fisher or its suitable habitat, including suitable post-fire habitat, USFS
10 must reinitiate consultation on the projects and obtain concurrence or take authorization from
11 FWS pursuant to section 7(a)(2) of the ESA, 16 U.S.C. § 1536(a)(2), that adequately and
12 meaningfully evaluates both the survival and recovery of the species based on credible science and
13 current data concerning population size and viability.

14 8. Unless and until USFS receives such FWS authorization on any project that may
15 affect the SSN fisher or its suitable habitat, USFS and its contractors are prohibited under section
16 7(d), 16 U.S.C. § 1536(d), from making any irreversible or irretrievable commitment of resources,
17 including the logging of trees, the removal of structural components like snags on which fishers
18 rely, or other “vegetation management” activities that may affect fisher use.

Third Cause of Action

Violation of NEPA for Failure to Prepare Supplemental Cumulative Impacts Analysis (Against Defendant U.S. Forest Service)

22 9. Plaintiffs hereby reallege and incorporate by reference, as if fully set forth herein,
23 each and every allegation in the preceding paragraphs.

24 10. Defendant USFS has violated, and is continuing to violate, NEPA by failing to
25 prepare landscape-level supplemental environmental review of the cumulative impacts to the SSN
26 fisher DPS from the drought, associated tree mortality, substantial wildfires, and continued
27 logging, including post-fire logging of suitable fisher habitat, and other USFS activities that have
28 occurred in the Sierra, Sequoia, and Stanislaus National Forests over the last decade.

11. Although USFS previously issued Environmental Assessments or categorical
exclusions for many projects, the analyses in those documents have been rendered obsolete and
inadequate by the alteration, reduction, or degradation of SSN fisher habitat as a result of the
Creek and SQF Complex/Castle Fires in late 2020. These events constitute significant new
information and changed circumstances that require supplemental NEPA review and an updated
landscape-level cumulative impacts analysis, including a full and meaningful consideration of
alternatives and mitigation measures, based on the current credible science and current population
estimates.

9 12. The failure of USFS to comply with its mandatory legal duties under NEPA is
10 harming the interests of Plaintiffs and their members in the conservation and long-term survival of
11 the SSN fisher and in the restoration of a healthy, interconnected ecosystem across the national
12 forest landscape in the southern Sierra Nevada. Because USFS's actions are arbitrary, capricious,
13 an abuse of discretion, and otherwise not in accordance with law, they are subject to judicial
14 review under 5 U.S.C. § 706(2).

PRAYER FOR RELIEF

16 WHEREFORE, Plaintiffs respectfully request that the Court:

17 1. Declare that the 2020 Programmatic Biological Opinion/Incidental Take Statement
18 and the 2021 Programmatic Biological Opinion violate the ESA and the APA;

19 2. Set aside the 2020 Programmatic Biological Opinion/Incidental Take Statement
20 and the 2021 Programmatic Biological Opinion:

21 3. Enjoin USFS from relying on any concurrence or authorization conveyed by the
22 2020 Programmatic Biological Opinion/Incidental Take Statement and the 2021 Programmatic
23 Biological Opinion until and unless these documents are revised to fully comply with the ESA and
24 the APA;

25 4. Declare that USFS is violating NEPA by its failure to prepare and circulate for
26 public review supplemental environmental review that adequately and meaningfully considers the
27 cumulative landscape impacts from its ongoing, proposed, and reasonably foreseeable projects on
28 SSN fisher habitat and the survival and recovery of the species;

1 5. Enjoin USFS from carrying out, or permitting its contractors to carry out, any
2 projects that may affect SSN fishers or their habitat, including post-fire habitat, until and unless
3 USFS prepares and circulates a supplemental NEPA analysis that evaluates the cumulative effects
4 of its ongoing, proposed, and reasonably foreseeable projects on the species and habitat;

5 6. Award Plaintiffs their reasonable attorneys' fees, costs, expenses, and
6 disbursements associated with this action; and

7 7. Grant Plaintiffs such additional relief as the Court may deem just and proper.
